

Bi-Folding Doors

Security

There are many Bi-Folding Doors sold on the market. Some are aesthetically non-appealing because the gearing can be exposed on the inside against other's that have a secure rolling system as seen below.

As used on some uPVC and Aluminium Bi-Folding Doors

View from inside

Exposed track

View from inside

Concealed track

Whether opening in or out the track and fixings are concealed when the doors are closed.

All internal and external aluminium Bi-Fold Doors manufactured by Duration are fingertip smooth to operate, fit flush to the floor when fitted and thus increases security because the runners and screws are not exposed.

Please remember to check before you purchase from any supplier that the gearing system is not exposed externally.

Making this a more secure Bi-Fold Door.
